**ZenXML 0.1.4 PC/Windows**

zenXML is mainly used to convert between XML and structured data. This is done by applying automated type conversions, all values are wrapped with convenient type objects. For high performance, only parts of the data are

---

exposed as primitives, depending on the data's usefulness and the intended use. zenXML is used on server-based architectures, and therefore it has been optimized to be efficient in terms of memory footprint as well. You can compile zenXML as part of your application, and then use the resulting "apk" file. When the library is used in order to create a "standalone" application, it is recommended to use a library-specific makefile when making use of zenXML. This way a stand-alone zenXML

---

binary is created. Installing zenXML Change directory to where you extracted the archive. `cd./build-tools` Run the following command in order to compile zenXML: `./compile.sh`

You can build zenXML for Android by using ant. Run the following command in order to build zenXML for Android: To see which features of zenXML you've been using so far: `# zenXML version` You can use this command to execute a simple zenXML example. `# zenXML example` When you installed the zenXML library, it

was copied into your Eclipse workspace as a workspace project (usually in the "workspace-src" directory). By executing the example on the command line, you can see what's going on behind the scene: Zoller (surname) Zoller is a surname. python-based, pure C++ library  
to serialize arbitrary user data  
in a type-safe way. The library is  
implemented as a pure C++  
library. Hence only those few  
hints are required, which are  
necessary to build the

---

serialization library. XML data representation and processing zenXML allows to represent any user object and to transfer the data between two running programs/components via HTTP-POST-request/response. The XML schema of zenXML as well as the syntax of the XML structure is documented, with detailed examples. The library can be extended without changing its API-interface by plugin modules. They can be developed by anyone with a decent understanding of Python programming language. C++

---

API The library provides a C++ API for C++ programmers, to handle, transfer and process the data. This offers many possibilities to implement efficient solutions for different problems. C++ API Description: A binding for the C++ API with Python. Allows to convert data from a Python object to a zenXML object and vice-versa and to send and receive data via HTTP-POST-request/response. Direct XML serialization zenXML is able to serialize Python objects in the same way a "normal" XML-

---

serializer works. This means, no over-the-wire conversion of Python objects to XML data is necessary. Direct XML serialization Description: zenXML creates a zenXML object, consisting of the name space, the root element, the child elements and the elements' content. Based on this data object, zenXML can write any object to XML and vice versa. This approach is suitable for general usage. It works without knowing any information about the C++ object representation. Swiss-

army knife of Python XML libraries zenXML is at the same time a generic XML library, a data-to-XML-library and a XML-to-data-library. This makes it easy to combine the different solutions, for C++ programmers, for Python programmers and for other programming languages like Java. [Please note, that this library is not officially supported by ZENworks AB. Any report about this product should therefore be addressed to ZENworks AB in kontakt@zenworks. b7e8fdf5c8

=====  
The zenXML library provides  
serialized XML string  
representations in terms of  
classes derived from struct  
zen\_doc\_xml. All container  
classes such as vector or map  
support the writing of XML-  
serialized data easily. Authors

spongiform encephalopathy: a disease process which affects the brain. Brains from cattle affected with bovine spongiform encephalopathy (BSE) show several histopathological lesions typical of prion diseases. Prion protein is now known to be abnormal and to be the infectious agent associated with prion diseases. The normal

---

cellular prion protein (PrP-C) is encoded by a single-copy gene (Prn-C) on chromosome 20 and replaces the Prn-S (mammalian homologue of the normal scrapie prion protein) on chromosome 4. Proteinase K digestion liberates a fragment (PrP-C1) equivalent to human or rat PrP-C. The prion protein precursor, PrP-C, is processed by a protease in the endoplasmic reticulum, generating two fragments known as PrP-C1 (octapeptide) and PrP-C2 (glycophosphatidylinositol-anchored protein), and a

---

cell surface associated molecule, PrP-C3. All BSE cases described thus far have shown a change at codon 211 of the Prn-S gene that results in expression of a PrP-res protein containing amino acids Gly216, Glu217, and Ala218 (PrP-res(GGA)), as opposed to Gly218 in normal cells. Furthermore, it has been shown that this mutation is responsible for the pathogenesis of BSE. The discovery of these mutations has given us a promising molecular marker for the detection of BSE.
